

Flexible assembly

The span wire system is also available in a version with rails, giving flexibility to your presentations. There is a rail for wall attachment and one for attachment between floor and ceiling. Both types are supplied with 400cms steel wire.

By means of the "spanner" the presentation is always kept tight into place. The big advantage of the rail application is that adding, removing and switching of the span wire system is very easy. In this way you have a flexible presentation which can be created to your own liking.

Description
